

HIGH-PERFORMANCE PLASTICS

DURATRON® PAI T4301 T4501

Amorphous plastic, with addition of PTFE and graphite, which provides greater wear resistance and lower coefficient of own friction, as well as a lower tendency for sliding. DURATRON® T4301 PAI also offers excellent dimensional stability over a wide range of temperatures. DURATRON® T4501 PAI and DURATRON® T4301 PAI have similar characteristics, being complementary in terms of availability and manufacturing format.

MAIN CHARACTERISTICS

- ◆ High maximum service temperature in the air (250° C in continuous service)
- ◆ Excellent retention of mechanical resistance, stiffness and creep resistance over a wide range of temperatures
- ◆ Excellent dimensional stability up to 250°C
- ◆ Excellent wear and friction behaviour (particularly Duratron T4503)
- ◆ Very good resistance to UV rays
- ◆ Exceptional resistance to high energy radiation (gamma rays and X-rays)
- ◆ Inherent low flammability

APPLICATIONS

- ◆ Non-lubricated bearings
- ◆ Seals
- ◆ Bearing cages
- ◆ Reciprocating compressor parts

COMPARATIVE TRACKING INDEX (CTI)	IEC 60112	-	175

NOTE: 1 g/cm³ = 1000 kg/m³ ; 1 MPa = 1 N/mm² ; 1 KV/mm = 1 MV/m

(1) According to method 1 of iso 62 and done on discs ø 50x3 mm (2) The figures given for this properties are only attributed to amorphous rather than semi-crystalline materials. (3) For short exposure periods only (a few hours) in applications where only very low loads are applied to the material. (4) Temperature which it resists for a minimum period of 20,000 hours. After this time, there is a decrease of about 50% in tensile strength compared to the original value. The given temperature values are based on the thermal oxidation degradation which causes a reduction of the properties. In the meantime, the maximum permissible service temperature depends in many cases essentially on the deduction and magnitude of the mechanical stresses to which the material is subject. (5) As the impact strength decreases with decreasing temperature, the minimum permissible service temperature is determined by the extent of impact to which the material is subjected. The values given are based on unfavorable impact conditions and can not therefore be considered absolute limits. (6) These assessments are derived from the technical specifications of the manufacturers of the raw materials and do not allow the determination of the behavior of the materials under fire conditions. There is no yellow card for these formats. (7) Most of the figures given by the mechanical properties of the extruded materials are mean values of the tests done on specimens machined with ø 40-60 mm. With the exception of hardness tests, the best specimens were taken from an area between the center and outer diameter, with their length in the longitudinal direction (parallel to the direction of extrusion). (8) Specimen testing: Type 1b. (9) Speed test: 5 or 50 mm / min. (10) Speed test: 1 mm / min. (11) Test specimens: cylinders ø 8x16 mm. (12) Pendulum used: 4J. (13) Test on 10 mm thick specimens. (14) Test on 1 mm thick specimens.

The dielectric strength of the Ketron Peek 1000 (black) Ppsu 1000 black may be considerably lower than the figures listed in the table referring to non-black materials. It should be noted that the values of the compression properties of the Duratron 4503 PAI and 4501 PAI alloys may differ significantly.
